Background

FABP2, also known as the intestinal fatty acid binding protein (I-FABP), is expressed in the absorptive intestinal villous cells. It is mainly involved in intracellular transport and intestinal absorption of lipids. FABP2 has been considered a marker of mucosal injury and ischemia and serum I-FABP level is used as a tissue damage indicator. In addition, it is a marker of differentiated intestinal epithelial cells.

Synonyms

FABP2, FABPI, Fatty acid binding protein 2, I FABP

Selected Validation Data

Immunohistochemical analysis of paraffin-embedded human small intestine tissue slide using KHC0251 (FABP2 IHC Kit).
